PRIMARY-EXAMINER: Gordon; Paul P.

ABSTRACT:

Data in disparate formats from different data sources are reformatted into a common data format and stored in database servers serving one or more data sources such that each

format and stored in database servers serving one or more data sources such that each database server contains only a portion of the composite database. A client server and graphical user interface are provided for allowing a client to perform simple search requests on one database server, browse requests on all database servers, or serve complex search requests on one or more database servers. The client server may reformat the resultant search data into one or more specific database formats for retrieval and manipulation by a specific database program or display the information for the client. The present invention has particular application to the semiconductor manufacturing field, for tracking data produced during the processes of semiconductor manufacturing.

ABSTRACT:

A method for synchronizing a first database with a second database in which the first database contains a plurality of database records. The first database is divided into a plurality of segments. Each of the segments contains at least one database record. The
